Experimental reconstruction of the unfolding process of the electromagnetically launched flexible tethered net

Presenter: Meina Wang

Date: June 3, 2024

PaperID:2024076

Supervisors: Ban Wang / Maoying Zhou

University: Hangzhou Dianzi University

Table of Contents

- 1 **Research Background**
- 2 **Research Content**
- 3 **Innovative Aspects of the Content**
- 4 **Research Outlook**

1. Research Background—Methods of Capturing Space Debris

Space Debris

Robotic Arm

- **High Costs**

Laser Propulsion

- **High Precision**

Electromagnetic Pulse

- **High Energy Support**

Net Capture

1. **Non-destructive Capture**
2. **Efficient Coverage Range**
3. **Flexibility and Adaptability**
4. **Operational Safety**
5. **Technological Scalability**

1. Research Background — Current Research Status of Net Launching

European Space Agency (ESA) e.Deorbit Project (Spring)

Unmanned Aerial Vehicle Capture and Recovery Scheme (Fire Control)

University at Buffalo - Net Capture Device (High-Pressure Gas)

Net Rotation Unfolding (Electric Motor)

- **Difficulty in controlling launch velocity**

- **Low Launch Safety**

- **Low Launch Safety**

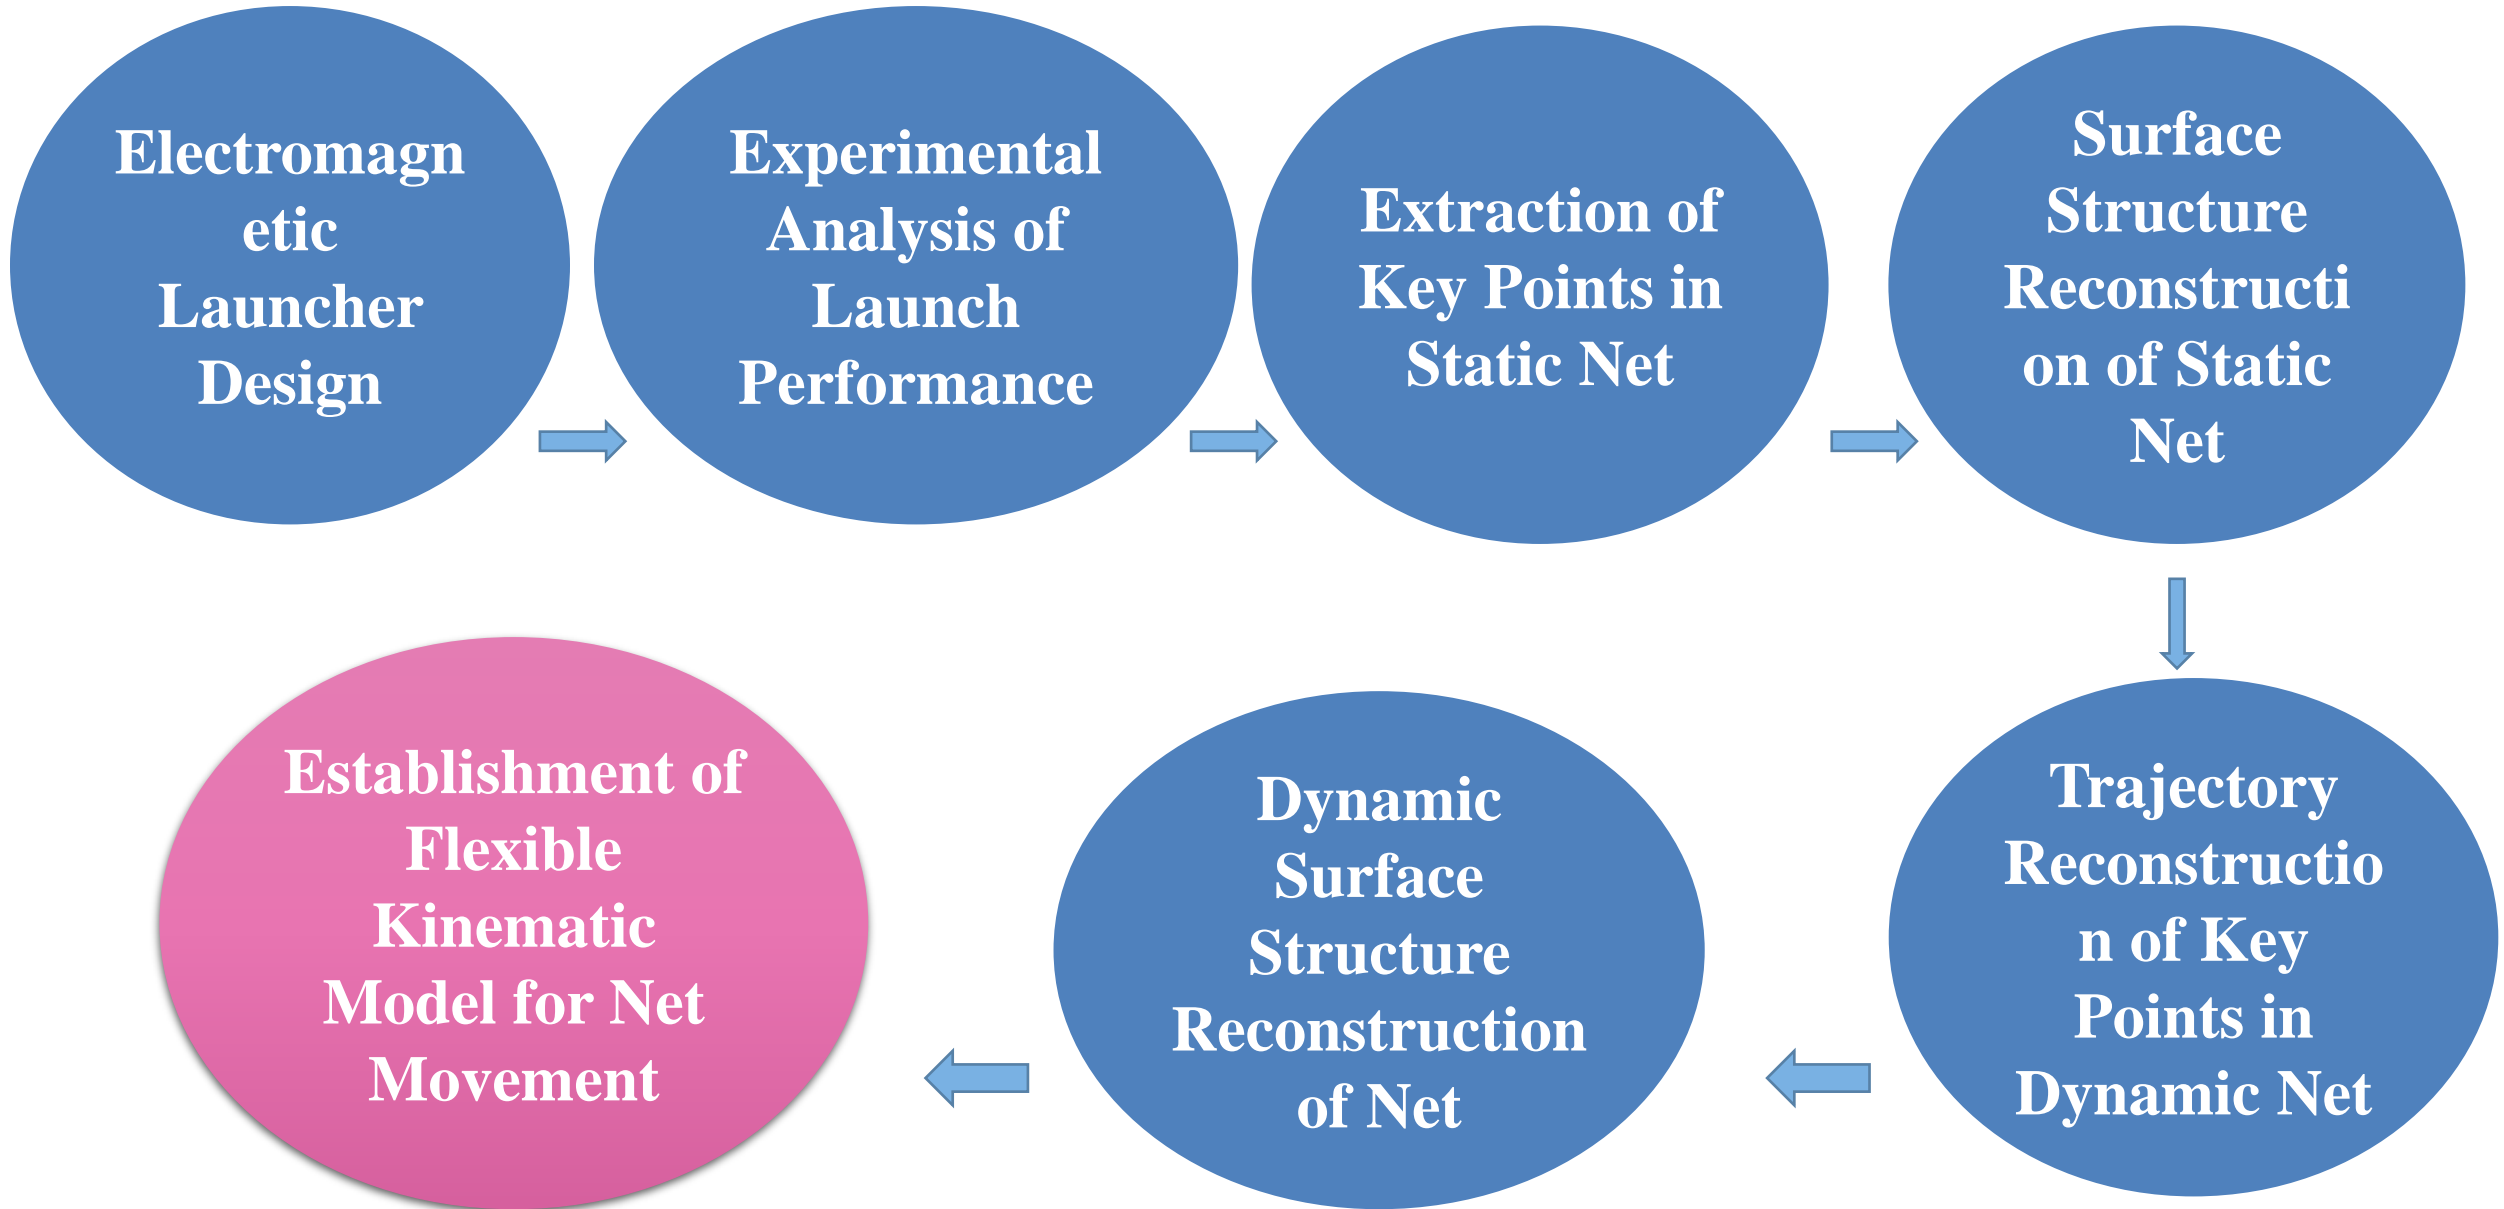

- **Complex Structure**

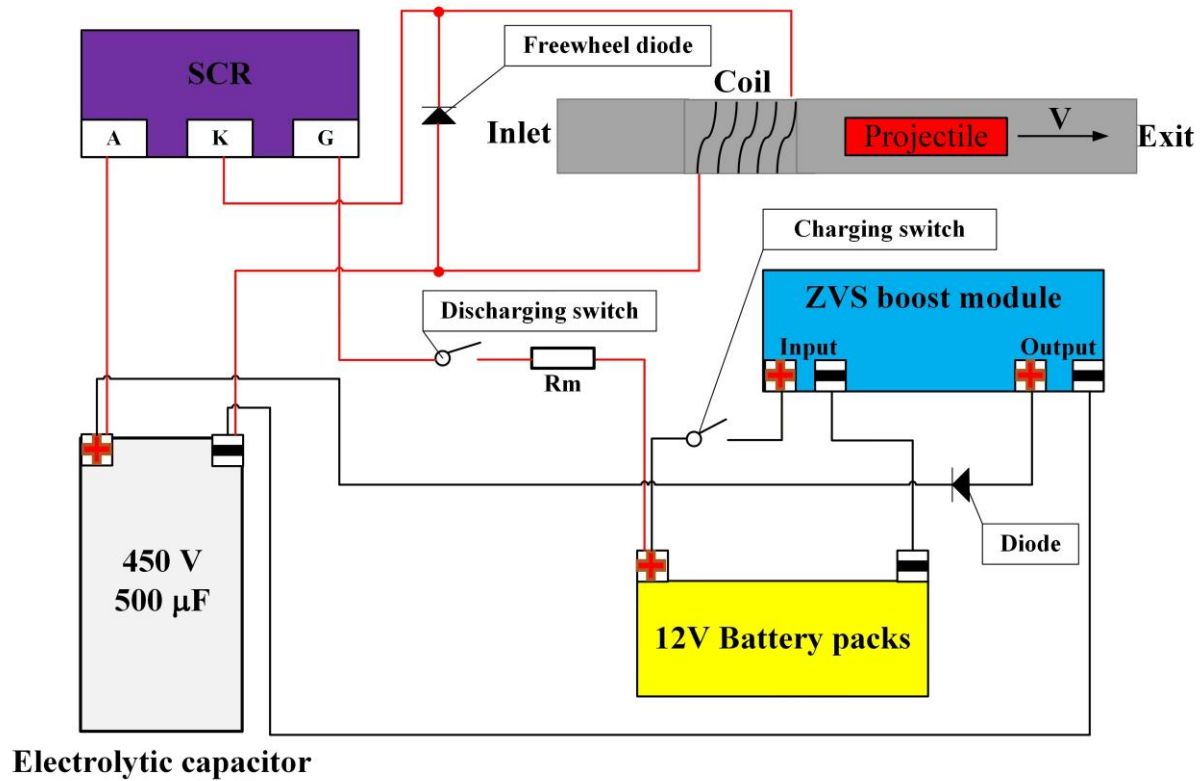

Electromagnetic Launch Technology

- **Short Acceleration Time, Fast Exit Velocity, Lower Control Difficulty**

2. Research Content—Research Plan

2. Research Content—Electromagnetic Launcher Design

circuit design

Control Circuit

2. Research Content—Electromagnetic Launcher Design

magnetic field

copper coil

iron mass block

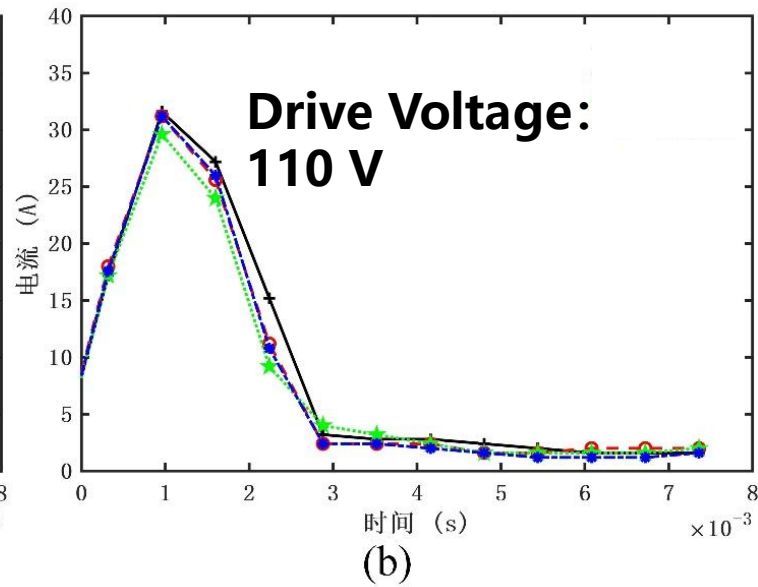

The electromagnetic force ejects the iron mass block

2. Research Content—Electromagnetic Launcher Design

Physical Diagram

2. Research Content—Experimental Analysis of Launch Performance

1. The current variation curves in the four coils are basically consistent.

2. When the voltage reaches 120V, the net can fully unfold.

2. Research Content—Experimental Analysis of Launch Performance

Impact of Net Material and Shape on Launch

- The net opening is too small, causing significant motion blur during dynamic movement, affecting analysis.

- The net is too light, resulting in excessive altitude during launch and inability to fully unfold.

- The net has a good shape and optical markers have been added, enabling effective capture of motion trajectories.

2. Research Content

Overall Scene Setup

2. Research Content—Extraction of Key Points in Static Net

Harris

- Severe Clustering Phenomenon

SIFT

- Key Points Cluttered

Hand

- Accurate and Clear

2. Research Content—Extraction of Key Points in Static Net

Camera Calibration

Structured Light Method

Phase Measurement Calibration

Three-dimensional Calibration Object

Projection Equipment Needed

Checkerboard Calibration

Phase Decoding Required

- High precision
- Simple operation
- Good robustness

Three-dimensional Calibration Object Fabrication

2. Research Content—Extraction of Key Points in Static Net

Camera Calibration Result Image

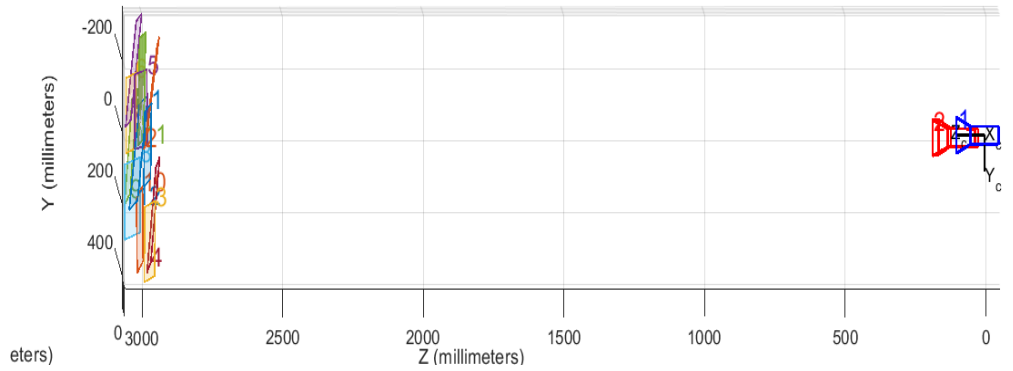

Align horizontally

2. Research Content—Extraction of Key Points in Static Net

Validation of Camera Calibration Results

compare the left View, the right View, and the top View with the actual scene data.

Camera Parameters

```
# 左相机内参矩阵
K_left = np.array([[1.98947506e+03, 0.00000000e+00, 9.72976686e+02],
                  [0.00000000e+00, 1.99483811e+03, 5.91592110e+02],
                  [0.00000000e+00, 0.00000000e+00, 1.00000000e+00]])

# 右相机内参矩阵
K_right = np.array([[1.98050314e+03, 0.00000000e+00, 9.75983368e+02],
                   [0.00000000e+00, 1.97975188e+03, 6.22379878e+02],
                   [0.00000000e+00, 0.00000000e+00, 1.00000000e+00]])

# 左相机到右相机的旋转矩阵和平移向量
R = np.array([[0.98348547, 0.0022631, 0.18097295],
              [-0.00326541, 0.99998094, 0.00524067],
              [-0.18095764, -0.00574507, 0.98347411]])

T = np.array([[-18.1609401],
              [-1.26707581],
              [-2.18217297]])
```

左相机投影矩阵 P_left:

```
[[1.98947506e+03 0.00000000e+00 9.72976686e+02 0.00000000e+00]
 [0.00000000e+00 1.99483811e+03 5.91592110e+02 0.00000000e+00]
 [0.00000000e+00 0.00000000e+00 1.00000000e+00 0.00000000e+00]]
```

右相机投影矩阵 P_right:

```
[[ 1.77118441e+03 -1.12501611e+00 1.31827187e+03 -3.80975634e+04]
 [-1.19089095e+02 1.97613853e+03 6.22469723e+02 -3.86663626e+03]
 [-1.80957640e-01 -5.74507000e-03 9.83474110e-01 -2.18217297e+00]]
```

Using the intrinsic parameters of the left and right cameras and the formula $P=K[R|t]$, calculate the projection matrices for the left and right cameras.

2. Research Content—Static Net Surface Structure Reconstruction

Key Point Matching

Matching
Left and
Right Points
Based on
Descriptors

Three-dimensional
Point Surface
Structure
Reconstruction

Three-dimensional
Point
Reconstruction

2. Research Content—Reconstruction of Key Point Trajectories in Dynamic Net

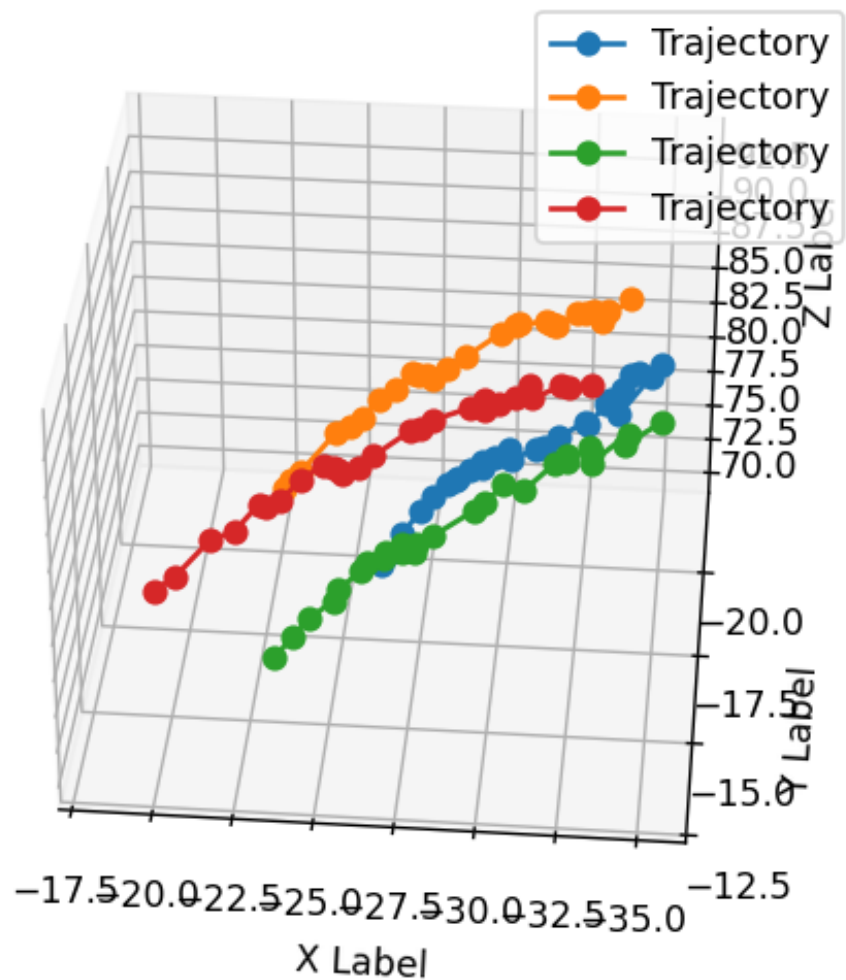

Left and right cameras capture the motion process separately, and dynamic reconstruction is based on static reconstruction.

2. Research Content—Reconstruction of Key Point Trajectories in Dynamic Net

3D Trajectory of Points

Single Point Motion Trajectory

Overall Motion Trajectory of Four Corner Points

2. Research Content—Dynamic Surface Structure Reconstruction of Net

4. Research Outlook

Utilizing Neural
Networks to Identify
Key Points

Refinement of
Three-Dimensional
Model
Establishment

Theoretical Innovation
in Algorithm and
Dynamics
